Outline

- Research Scope
- Literature Review
- Problem Definition
- Algorithm
 - Framework
 - Design
- Implementation
- Evaluation
- Conclusion
- Appendix
 - References
 - Support Plugin Development

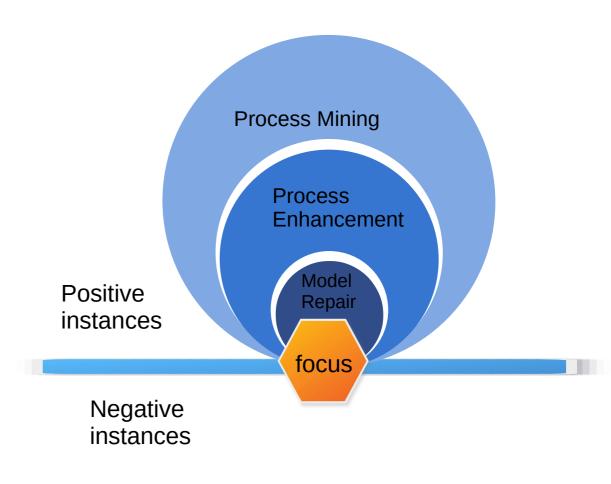

Scope

- Process Mining
- Process Enhancement
 - Reference model
- Model repair
 - Fitness
 - Similarity
- Performance
 - Negative instances

Literature Review

Rediscovery

Inductive Miner

Model Repair by Fahland

- Deviations
- Subprocesses

Model Repair by Dees

- Data with performance labels
- Classify deviations
- Fahland's repair only on positive deviations

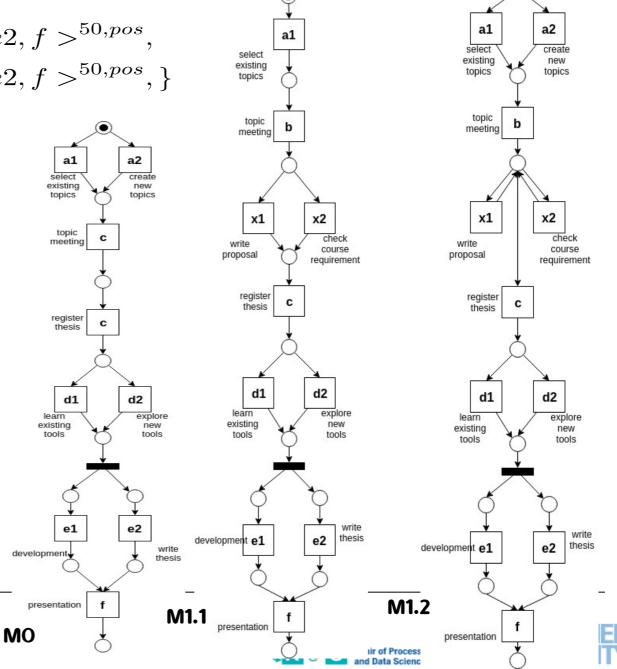

Research Problem - shortcominngs

$$L_1 := \{ \langle a1, b, \mathbf{x1}, c, d1, e1, e2, f \rangle^{50, pos},$$

 $\langle a1, b, \mathbf{x2}, c, d2, e1, e2, f \rangle^{50, pos}, \}$

5

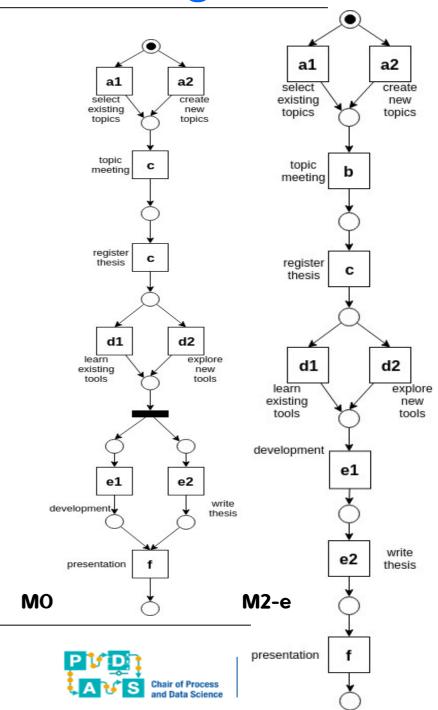

- IM not consider reference model
 - Inductive Miner- Infrequent
 - Noise threshold: 20%
- Fahland's: add subprocesses as loops
 - Default setting
 - Deviation found at same place
 - Subprocesses as loops
- Dee's: same as Fahland's method
- Similarity, Precision decrease

Research Problem - shortcomings

$$L_2 := \{ \langle a1, b, c, d2, \mathbf{e1}, \mathbf{e2}, f \rangle^{30,pos}, \ \langle a2, b, c, d1, \mathbf{e1}, \mathbf{e2}, f \rangle^{20,pos}; \ \langle a2, b, c, d2, \mathbf{e2}, \mathbf{e1}, f \rangle^{10,pos}; \ \langle a1, b, c, d2, \mathbf{e2}, \mathbf{e1}, f \rangle^{20,neg}, \ \langle a1, b, c, d1, \mathbf{e2}, \mathbf{e1}, f \rangle^{20,neg}; \ \langle a2, b, c, d1, \mathbf{e1}, \mathbf{e2}, f \rangle^{5,neg} \}$$

- IM keeps the model same
- Fahland's keep model same
- Dee's keep model same
- Unable to adapt model with fit traces

Research Problem – shortcomings

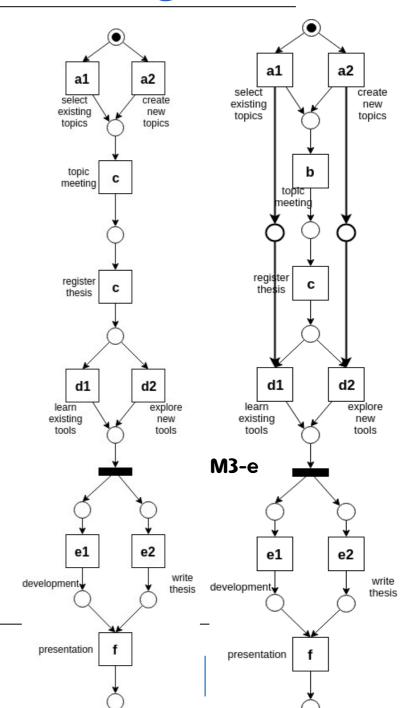

$$L_3 := \{ \langle \mathbf{a1}, b, c, \mathbf{d1}, e1, e2, f \rangle^{50,pos},$$

$$\langle \mathbf{a2}, b, c, \mathbf{d2}, e1, e2, f \rangle^{50,pos};$$

$$\langle \mathbf{a1}, b, c, \mathbf{d2}, e1, e2, f \rangle^{50,neg},$$

$$\langle \mathbf{a2}, b, c, \mathbf{d1}, e1, e2, f \rangle^{50,neg} \}$$

- Long-term dependency
 - Choices decides choices
 - Additional places to limit behavior
- Unable to detect long-term dependency

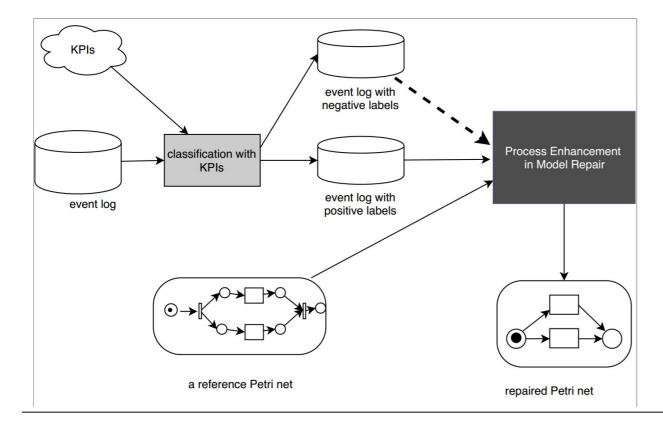

MO

Research Problem

Given an event log with labels, a reference Petri net, how to incorporate negative instances to generate the repaired Petri net which supports better performance?

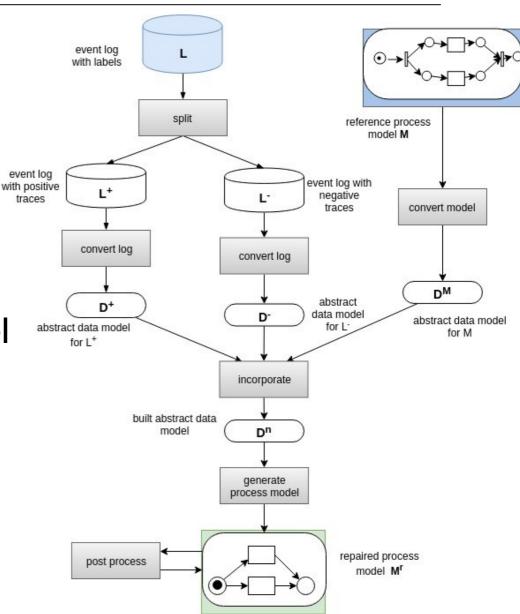

Algorithm – framework

Modules

- Data model
- Convert event log
- Convert model
- Incorporate
- Generate process model
- Post process

Data Model

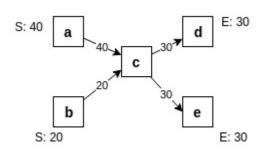

Directly-follows graph

- Directly-follows relation $a >_L b$

$$\exists \sigma \in L, 1 \leq i < |\sigma|, \sigma(i) = a \ and \ \sigma(i+1) = b.$$

A directly follow graph of an event log L is $G(L) = (A, F, A_{start}, A_{end})$ where Ais the set of activities in L, $F = \{(a, b) \in A \times A | a >_L b\}$ is the directly-follows relation set, A_{start}, A_{end} are the set of start and end activities respectively, $A_{start} = \{a | \exists \sigma \in L, a = \sigma(1)\}, A_{end} = \{a | \exists \sigma \in L, a = \sigma(|\sigma|)\}$

$$L = \{ < a, c, d >^{20}, < b, c, e >^{10}, < a, c, e >^{20}, < b, c, d >^{10} \}$$

Data Model

Cardinality of directly-follows graph

For any directly-follows relation

$$\forall (a,b) \in F, c(a,b) = \sum_{\sigma \in L} |\{i \in \{1,2...|\sigma|\} | \sigma(i) = \sigma(i+1)\}|$$

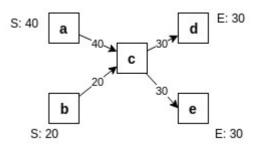

For start activity a

$$\forall a \in A_{start}, c(a) = \sum_{\sigma \in L} |\{\sigma | \sigma(1) = a\}|$$

- For end activity b

$$\forall a \in A_{end}, c(a) = \sum_{\sigma \in L} |\{\sigma | \sigma(|\sigma|) = a\}|$$

$$L = \{ < a, c, d >^{20}, < b, c, e >^{10}, \ < a, c, e >^{20}, < b, c, d >^{10} \}$$

Convert to directly-follows graph

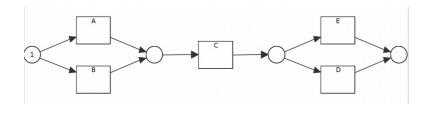

Petri net

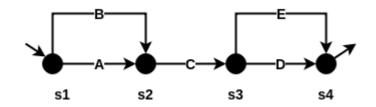

- Transition System
- Transitions before and after plugin states

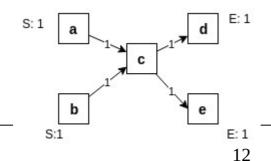

Event log

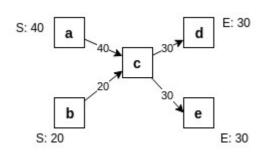

- Directly-follows relation

$$L = \{ \langle a, c, d \rangle^{20}, \langle b, c, e \rangle^{10}, \langle a, c, e \rangle^{20}, \langle b, c, d \rangle^{10} \}$$

Data Model

Unification of cardinality

- Models from existing model, positive and negative event log
- For any directly-follows relation

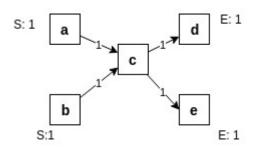

$$u(a,b) = \frac{c(a,b)}{\sum_{(a',b')\in F} c(a',b')}$$

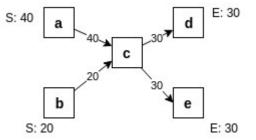

For any start activity

$$u(a) = \frac{c(a)}{\sum_{a' \in A_{start}} c(a')}$$

For any end activity

$$u(a) = \frac{c(a)}{\sum_{a' \in A_{end}} c(a')}$$

Incorporate Data Models

Given directly-follows graphs D^+, D^-, D^M

Incorporate method

For any directly-follows relation

$$u^{n}(a,b) = u^{M}(a,b) + u^{+}(a,b) - u^{-}(a,b)$$

For any start activity,

$$a \in A_{start}^{M} \cup A_{start}^{+} \cup A_{start}^{-}, u^{n}(a) = u^{M}(a) + u^{+}(a) - u^{-}(a)$$

For any end activity,

$$a \in A_{end}^M \cup A_{end}^+ \cup A_{end}^-, u^n(a) = u^M(a) + u^+(a) - u^-(a)$$

Weighted value

– Three control weights w^+, w^-, w^M

$$u_w^n(a,b) = w^M \cdot u^M(a,b) + w^+ \cdot u^+(a,b) - w^- \cdot u^-(a,b)$$

Generate Petri net

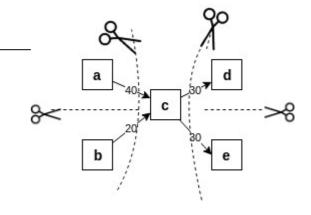

Choose directly-follows relation

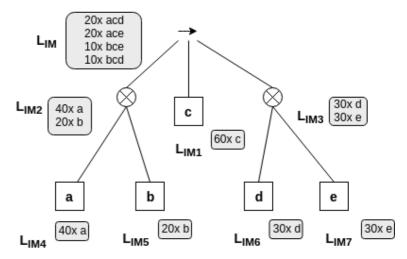

$$u_w^n(a,b) > t$$

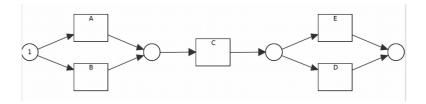

- t=0
- Assign normal cardinality back

$$-c^{n}(a,b) = u_{w}^{n}(a,b) \cdot (|L^{+}| + |L^{-}|)$$

- IM discovery algorithm
 - Directly-follows graph
 - Process tree
 - Petri net

Post Process Petri net

Long-term dependency

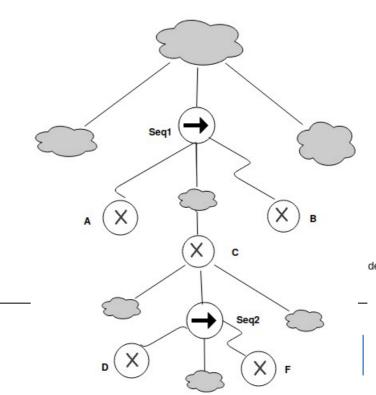

Choices dependency

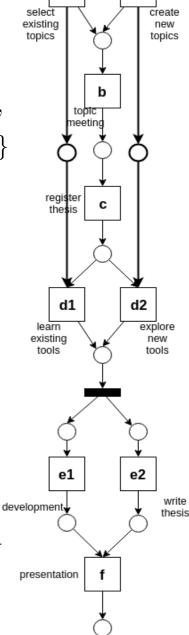

$$L_3 := \{ \langle \mathbf{a1}, b, c, \mathbf{d1}, e1, e2, f \rangle^{50, pos},$$

Exclusive choices

- < **a2**, b, c, **d2**, e1, e2, $f>^{50,pos}$;
- Xor block/branches
- $< \mathbf{a1}, b, c, \mathbf{d2}, e1, e2, f > 50, neg,$
- $\{ \mathbf{a2}, b, c, \mathbf{d1}, e1, e2, f > 50, neg \}$

- In order
 - Least common ancestor is Seq
 - A < C < B, D < F
 - In same level
 - A,B,C pair
 - D,F pair
- Strong correlation

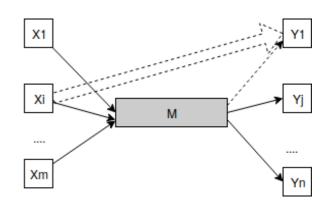

Post Process Petri net

Long-term dependency

- Strong correlation
 - Frequency

Frequency of an xor branch X_i in an event log L is the count of traces which replay this xor branch, $f: X \to N, f_L(X) = \sum_{\sigma \in L} |\{\sigma | \sigma \models X\}|$

Frequency of multiple xor branches is
$$f_L(X_1, X_2, ..., X_n) = \sum_{\sigma \in L} |\{\sigma | \forall X_i, \sigma \models X_i\}|$$

Correlation over t

$$d(X_i, Y_j) = w^+ \cdot d^+(X_i, Y_j) - w^- \cdot d^-(X_i, Y_j) > t$$

$$d^{+}(X_{i}, Y_{j}) = \frac{f_{L^{+}}(X_{i}, Y_{j})}{\sum_{Y^{k} \in T, k \neq j} f_{L^{+}}(X_{i}, Y^{k})} d^{-}(X_{i}, Y_{j}) = \frac{f_{L^{-}}(X_{i}, Y_{j})}{\sum_{Y^{k} \in T, Y^{k} \neq X_{i}} f_{L^{-}}(X_{i}, Y^{j})}$$

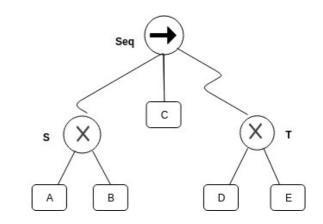

Long-term dependency Situations

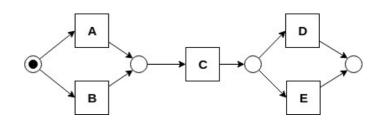

1.
$$LT = \{A \leadsto D, A \leadsto E, B \leadsto D, B \leadsto E\}.$$

 $LT_S = \{A, B\}, LT_T = \{D, E\}, |LT| = |S| \cdot |T|.$

$$LT_S := \{X_i | \exists Y_j, X_i \leadsto Y_j \in LT\}$$
$$LT_T := \{Y_j | \exists X_i, X_i \leadsto Y_j \in LT\}$$

- 2. $LT = \{A \leadsto D, A \leadsto E, B \leadsto E\}$. $LT_S = \{A, B\}, LT_T = \{D, E\}, LT_S = S \text{ and } LT_T = T, |LT| < |S| \cdot |T|$.
- 3. $LT = \{A \leadsto D, B \leadsto E\}.$ $LT_S = \{A, B\}, LT_T = \{D, E\} \ LT_S = S \text{ and } LT_T = T, |LT| < |S| \cdot |T|.$
- 4. $LT = \{A \leadsto D, B \leadsto D\}.$ $LT_S = S, LT_T \subsetneq T.$
- 5. $LT = \{A \leadsto D, A \leadsto E\}.$ $LT_S \subsetneq S, LT_T = T.$
- 6. $LT = \{A \leadsto E\}.$ $LT_S \subsetneq S, LT_T \subsetneq T.$
- 7. $LT = \emptyset$
 - Situation 1 is full dependency ==> no consideration
 - Situation 7 is empty. ==> no consideration

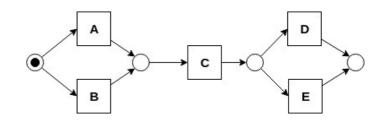

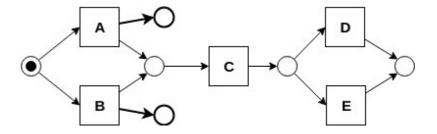

- How to express on Petri net
 - Add silent transition
 - Add control place as postplace post after S

 $LT = \{A \leadsto D, A \leadsto E, B \leadsto E\}.$

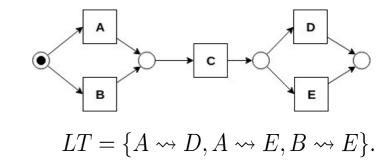

- How to express on Petri net
 - Add silent transition

 - 5. $LT = \{A \leadsto D, A \leadsto E\}.$ $LT_S \subsetneq S, LT_T = T.$
 - 6. $LT = \{A \leadsto E\}.$ $LT_S \subsetneq S, LT_T \subsetneq T.$
 - 7. $LT = \emptyset$
 - Situation 1 is full dependency ==> no consideration
 - Situation 7 is empty. ==> no consideration

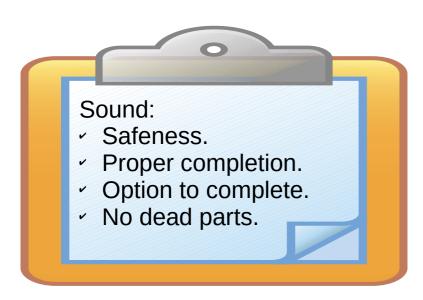

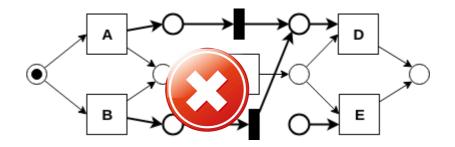

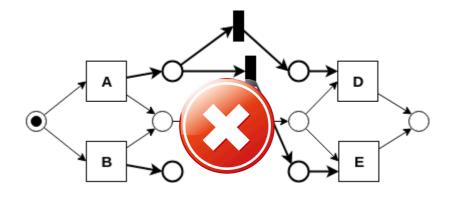

Express on Petri net

- 4. $LT = \{A \leadsto D, B \leadsto D\}.$ $LT_S = S, LT_T \subsetneq T.$
- 5. $LT = \{A \leadsto D, A \leadsto E\}.$ $LT_S \subsetneq S, LT_T = T.$
- 6. $LT = \{A \leadsto E\}.$ $LT_S \subsetneq S, LT_T \subsetneq T.$

Petri net – soundnes

Sound:

Safeness.

Places cannot hold multiple tokens at the same time.

- Proper completion.
 - If the sink place is marked, all other places are empty.
- Option to complete.
 - It is always possible to reach the final marking from any reachable marking.
- No dead parts.

For any transition, there exists a path from source to sink place through it.

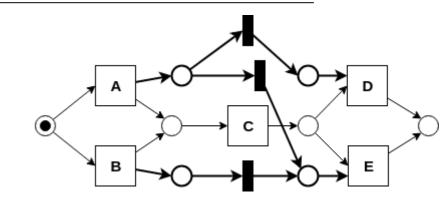

Soundness proof

Given $S = \{X_1, X_2, ... X_m\}$ and $T = \{Y_1, Y_2, ... Y_n\}$ with $LT = \{X_i \leadsto Y_j | 1 \le i \le m, 1 \le j \le n\}$. W.l.o.g., X_i is fired.

The marking distribution is

$$M(p_{X_i}) = 1; \quad \forall p_{X_{i'}} \in P_S, i' \neq i, M(p_{X_{i'}}) = 0$$

Type 1 $LT_S = S, LT_T = T$

soundness

Safeness.

$$\sum M(p_{X_i}) \le 1, \sum M(p_{Y_j}) \le 1$$

Proper completion.

After firing
$$Y_j$$
 , $\sum M(p_{X_i}) = 0, \sum M(p_{Y_j}) = 0$

Option to complete & No dead parts.

$$\forall X_i \in S \text{ is enabled at beginning} \ \forall X_i \in S, \text{since } LT_S = S, \Rightarrow \exists Y_j \in T, X_i \leadsto Y_j, \ \epsilon \text{ is enabled with } p_{X_i} \to \epsilon \to p_{Y_j} \ \forall Y_j \in T, \text{since } LT_T = T, \Rightarrow \exists X_i \in S, X_i \leadsto Y_j$$

Soundness proof

Given $S = \{X_1, X_2, ... X_m\}$ and $T = \{Y_1, Y_2, ... Y_n\}$ with $LT = \{X_i \leadsto Y_j | 1 \le i \le m, 1 \le j \le n\}$. W.l.o.g., X_i is fired.

The marking distribution is

$$M(p_{X_i}) = 1; \quad \forall p_{X_{i'}} \in P_S, i' \neq i, M(p_{X_{i'}}) = 0$$

A C D D E

Type 2 $LT_S \subsetneq S, LT_T \subsetneq T$

soundness

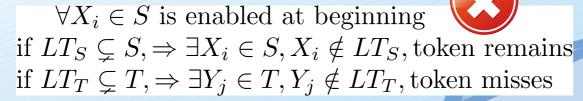

Safeness.

$$\sum M(p_{X_i}) \le 1, \sum M(p_{Y_j}) \le 1$$

Proper completion.

After firing
$$Y_j$$
, $\sum M(p_{X_i}) = 0$, $\sum M(p_{Y_j}) = 0$

Option to complete & No dead parts.

Long-term dependency Situations

1.
$$LT = \{A \leadsto D, A \leadsto E, B \leadsto D, B \leadsto E\}.$$

 $LT_S = \{A, B\}, LT_T = \{D, E\}, |LT| = |S| \cdot |T|.$

2.
$$LT = \{A \leadsto D, A \leadsto E, B \leadsto E\}.$$

 $LT_S = \{A, B\}, LT_T = \{D, E\} \ LT_S = S \text{ and } LT_T = T, |LT| < |S| \cdot |T|.$

3.
$$LT = \{A \leadsto D, B \leadsto E\}.$$

 $LT_S = \{A, B\}, LT_T = \{D, E\} \ LT_S = S \text{ and } LT_T = T, |LT| < |S| \cdot |T|.$

- 4. $LT = \{A \leadsto D, B \leadsto D\}.$ $LT_S = S, LT_T \subsetneq T.$
- 5. $LT = \{A \leadsto D, A \leadsto E\}.$ $LT_S \subsetneq S, LT_T = T.$
- 6. $LT = \{A \leadsto E\}.$ $LT_S \subsetneq S, LT_T \subsetneq T.$
- 7. $LT = \emptyset$

Sound:

- Safeness.
- Proper completion.
- Option to complete.
- No dead parts.

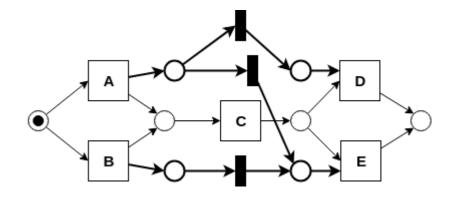

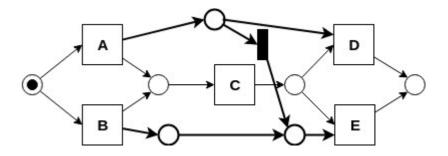

Post process

Delete redundant silent transitions

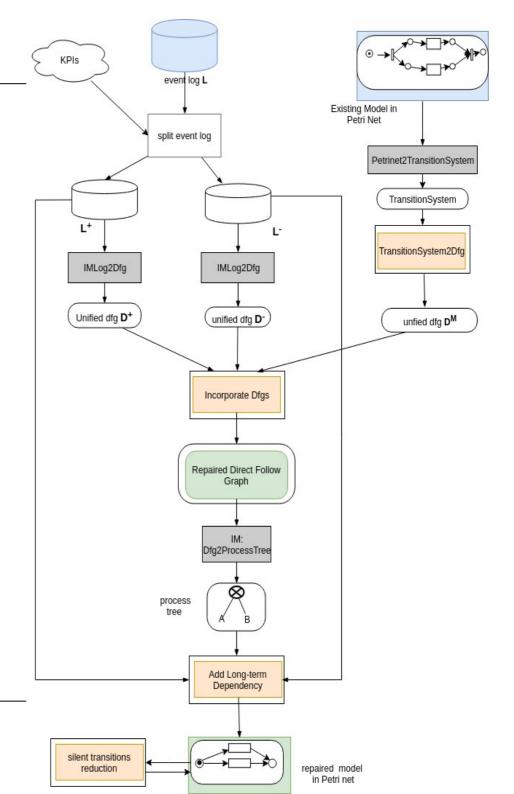

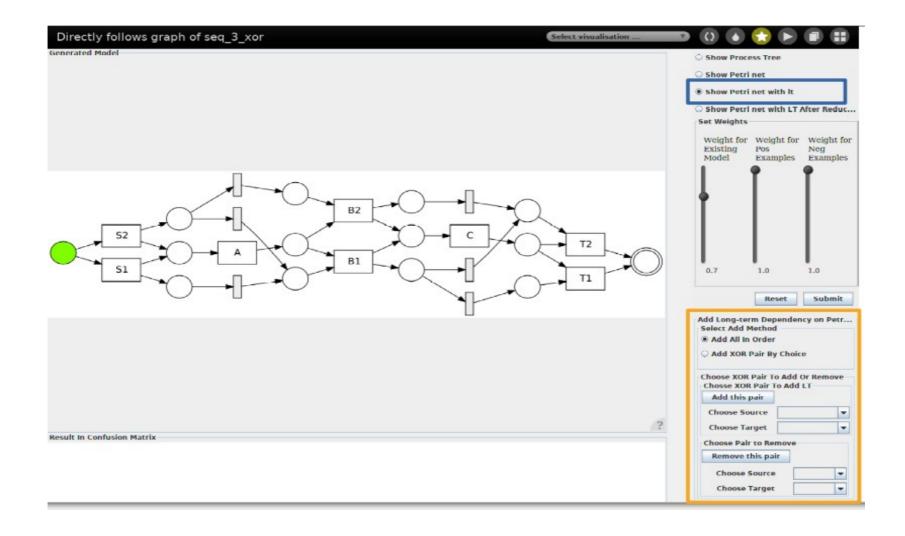

Algorithm – architecture

- Data model

	D4.3	0	0	149	346	0	NaN	0.301	0

Fanhland's method to repair M3 with default setting

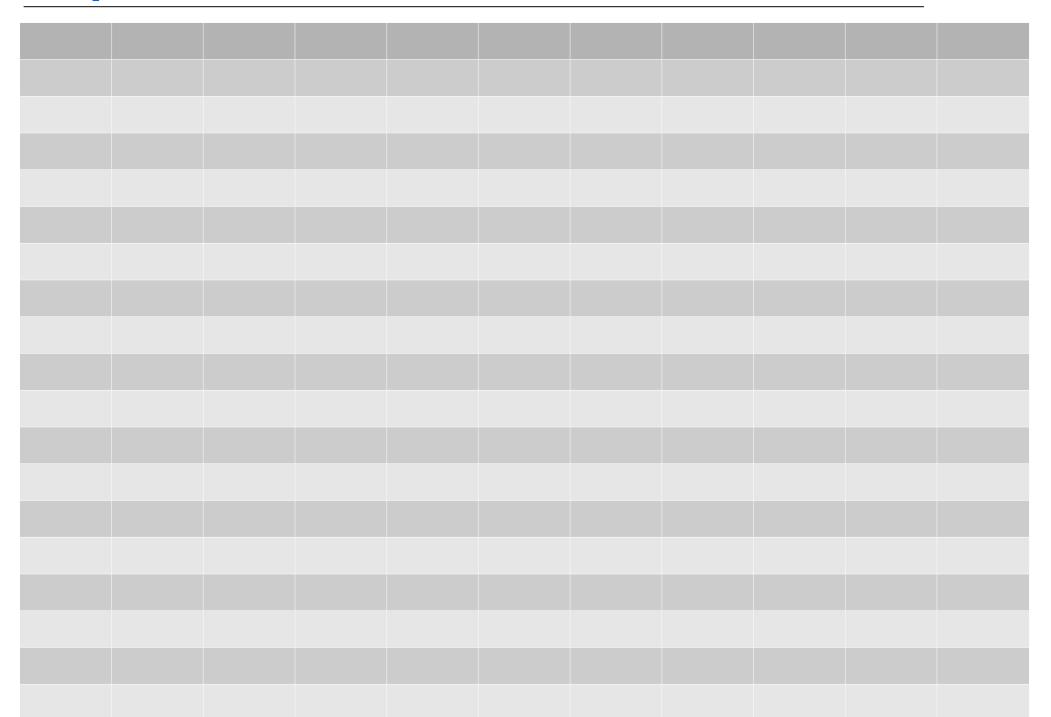

Dfg-repair with default setting

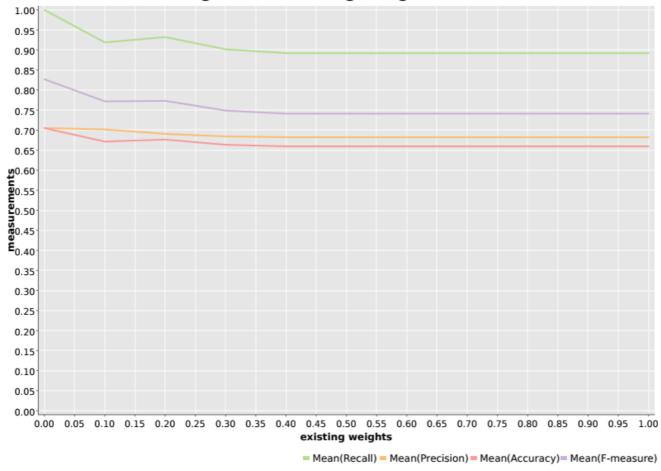

Much simpler with **less** silent transitions and **no** duplicate transitions

Weight for the reference model

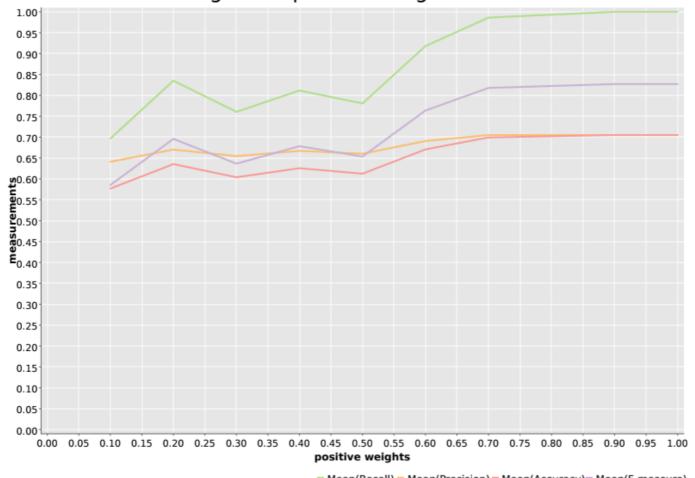

Measurements change with existing weight

Weight for positive instance

Measurements change with positive weight

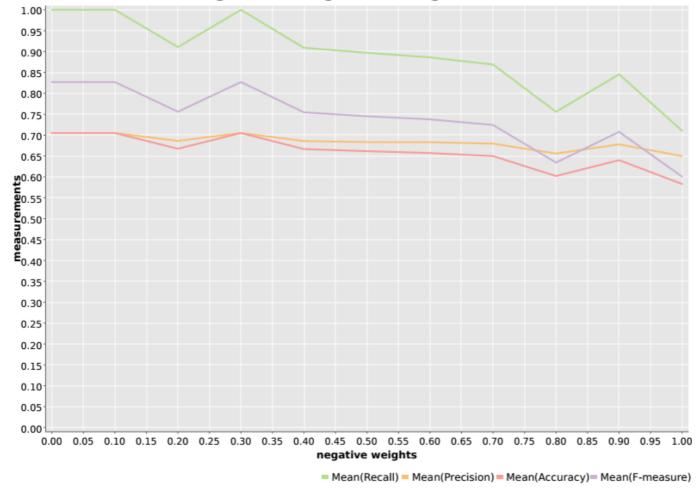

Mean(Recall) = Mean(Precision) = Mean(Accuracy) = Mean(F-measure)

Weight for negative instance

Measurements change with negative weight

Conclusion

- Conquer the shortcomings
- Repair model with better precision, accuracy,
 F1
- Repaired model simpler,
- Run faster

Feasible to use in practice

Further Work

- Improve the balance rules
- Improve the rules for long-term dependency
- Drop process tree as intermediate model
- Extend to another choice relation
